# Tables: one per figure

Table 1: **2010 Characteristics by Tract Treatment Status** This table presents summary statistics for 2010 PRCS (ACS 2006–2010 5-year) tract characteristics — all pre-determined relative to Act 22 (January 2012) — separated by tracts that ever receive an identified decree-era investor purchase (treated) and tracts that never do. Column (7) reports the raw mean difference between treated and never-treated tracts and column (8) the difference after residualizing out municipio (county) fixed effects, with heteroskedasticity-robust $p$-values in parentheses. Dollar variables in 2010 dollars; shares in [0,1]. 2010 tracts are mapped to 2020 boundaries by largest land overlap, population-weighted. Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

| | Treated Tracts | | | Never-Treated Tracts | | | Mean Diff. | Adj. Mean Diff. |

Table 2: **Tract-level treatment effects are robust to county-year shocks** This table reports Treated coefficients from the paper's baseline estimator — the pre-mean-differenced LP-DiD (Dube et al. 2023; $H$=3, $k$=4, clean-control sample: newly treated tracts at onset plus never-treated tracts) — under two specifications per outcome: (1) calendar-year effects; (2) county×year effects, so identification is within municipio-year. Tract fixed effects are subsumed by the long-differencing. Panel A: tract log price (Red Atlas, count-weighted annual mean) and log mean purchase-borrower income (HMDA, 2012–2024), both scaled by 100. Panel B: purchase origination counts by borrower ethnicity as 100 × asinh (Poisson does not compose with pre-mean differencing; the Poisson event studies appear in the figures). Robust standard errors are clustered at the tract level and reported in parentheses. Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

**Panel A: prices and borrower income**

| | *100 × Log(Price)* | | *100 × Log(Borrower Income)* | |
|---|---|---|---|---|
| | (1) | (2) | (1) | (2) |
| Treated | 6.44*** | 5.66*** | 8.10*** | 7.81*** |
| | (1.41) | (1.59) | (1.99) | (2.23) |
| Observations | 11,714 | 11,681 | 8,319 | 8,299 |

| Tract differencing (LP-DiD) | Yes | Yes | Yes | Yes |
| Calendar-year effects | Yes | No | Yes | No |
| County-year effects | No | Yes | No | Yes |

Table 3: **Price Effects by Investor Concentration: Ring and Tract Designs** This table reports LP-DiD price effects by investor concentration under both designs, on the tract design's dose convention. Columns (1)-(2): ring design, events split by total identified purchases within 1km of the event (the event itself included); each group's near rings (0–250m) vs never-treated control rings, cell-level annual LP-DiD. Columns (3)-(4): tract design, treated tracts split by identified purchases in the tract, each group vs never-treated tracts. The Treated coefficient is the post−pre effect from the single pre-mean-differenced LP-DiD regression (Dube et al. 2023), whose SE, R-squared, and Observations are reported. All outcomes 100×log price; SEs clustered by cell (ring) or tract. Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

| | *Ring design* | | *Tract design* | |
|---|---|---|---|---|
| | 1–4 purch. | 5+ purch. | 1–4 purch. | 5+ purch. |
| | (1) | (2) | (3) | (4) |
| Treated | -2.74 | 6.41*** | 4.13*** | 16.30*** |
| | (3.45) | (1.50) | (1.59) | (2.54) |
| Observations | 2,854 | 9,525 | 11,670 | 11,476 |
| R-squared | 0.074 | 0.217 | 0.153 | 0.152 |
| Unit differencing (LP-DiD) | Yes | Yes | Yes | Yes |
| Calendar-year effects | Yes | Yes | Yes | Yes |
| Never-treated controls | Yes | Yes | Yes | Yes |

Table 4: **Locals-only prices (fig. 10)** The Treated coefficient is the post−pre effect from a single LP-DiD regression via pre-mean differencing (Dube, Girardi, Jordà and Taylor 2023): dependent variable $\frac{1}{4}\sum_{h=0}^{3} y_{t+h} - \frac{1}{4}\sum_{\tau=t-4}^{t-1} y_\tau$ on treatment entry with calendar-time effects, clean-control sample; its SE, $R^2$ and Observations come from that regression. Coefficients are 100×log points (shares in pp). SEs clustered by unit (cell/tract). Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

| | All market sales | Hispanic-named buyers |

| | (0.68) | (0.66) |
| Observations | 12,230 | 12,189 |
| R-squared | 0.019 | 0.035 |
| Calendar-year effects | Yes | Yes |
| Event×ring cell differencing | Yes | Yes |
| Hedonic controls | No | No |

Table 12: **Ownership Transitions and Net Conversion (figs. 8, 8b, 8d)** Outcomes are shares of near-ring sales in which both parties' surnames classify: (1) Hispanic seller to non-Hispanic buyer; (2) non-Hispanic seller to Hispanic buyer; (3) their difference — the net rate at which the housing stock converts to non-Hispanic-named ownership per classified sale. Within-class churn nets out of column (3), and because the PMD estimator is linear, column (3) equals column (1) minus column (2) exactly. The Treated coefficient is the post−pre effect from a single LP-DiD regression via pre-mean differencing (Dube, Girardi, Jordà and Taylor 2023): dependent variable $\frac{1}{4}\sum_{h=0}^{3} y_{t+h} - \frac{1}{4}\sum_{\tau=t-4}^{t-1} y_\tau$ on treatment entry with calendar-time effects, clean-control sample; its SE, $R^2$ and Observations come from that regression. Coefficients are 100×log points (shares in pp). SEs clustered by unit (cell/tract). Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

| | Hisp.→non-Hisp. | non-Hisp.→Hisp. | Net conversion (1)−(2) |
|---|---|---|---|
| | (1) | (2) | (3) |
| Treated | 2.04*** | -0.33 | 2.37*** |
| | (0.65) | (0.52) | (0.88) |
| Observations | 12,035 | 12,035 | 12,035 |
| R-squared | 0.020 | 0.053 | 0.047 |
| Calendar-year effects | Yes | Yes | Yes |
| Event×ring cell differencing | Yes | Yes | Yes |
| Hedonic controls | No | No | No |

Table 13: **Buyer-margin decomposition (fig. 9)** The Treated coefficient is the post−pre effect from a single LP-DiD regression via pre-mean differencing (Dube, Girardi, Jordà and Taylor 2023): dependent variable $\frac{1}{4}\sum_{h=0}^{3} y_{t+h} - \frac{1}{4}\sum_{\tau=t-4}^{t-1} y_\tau$ on treatment entry with calendar-time effects, clean-control sample; its SE, $R^2$ and Observations come from that regression. Coefficients are 100×log points (shares in pp). SEs clustered by unit (cell/tract). Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

| | Non-investor sales | All sales |
|---|---|---|
| | (1) | (2) |
| Treated | 5.32*** | 5.30*** |
| | (1.40) | (1.35) |
| Observations | 12,379 | 12,404 |
| R-squared | 0.154 | 0.156 |
| Calendar-year effects | Yes | Yes |
| Event×ring cell differencing | Yes | Yes |
| Hedonic controls | No | No |

Table 14: **Estimation-approach robustness (fig. D12)** The Treated row is the comparable post−pre differential across estimators. Column (1): cell-level LP-DiD, pooled never-treated controls; coefficient, $R^2$ and N from the single pre-mean-differenced regression (Dube et al. 2023). Column (2): the same PMD regression with event×calendar-year effects absorbed (within-event identification: each near ring vs its own event's far ring). Columns (3)-(4): stacked sale-level OLS; the near×post coefficient is itself the differential, SEs clustered by event. Long-differencing subsumes event×ring FE in the LP-DiD columns. 100×log points. Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

| | LP-DiD cells | LP-DiD within-event | Sale-level OLS | Sale-level OLS |
|---|---|---|---|---|
| | (1) | (2) | (3) | (4) |
| Treated | 5.32*** | 3.16** | 7.09*** | 6.72*** |
| | (1.40) | (1.43) | (1.58) | (1.32) |
| Observations | 12,379 | 2,164 | 777,666 | 730,276 |
| R-squared | 0.154 | 0.650 | 0.172 | 0.344 |
| Event×ring FE | (diff.) | (diff.) | Yes | Yes |
| Event×year FE | (diff.) | Yes | Yes | Yes |
| Hedonic controls | No | No | No | Yes |

Table 15: **Spatial decay, 1.5–2km control band (figs. D1–D3)** The Treated coefficient is the post−pre effect from a single LP-DiD regression via pre-mean differencing (Dube, Girardi, Jordà and Taylor 2023): dependent variable $\frac{1}{4}\sum_{h=0}^{3} y_{t+h} - \frac{1}{4}\sum_{\tau=t-4}^{t-1} y_{\tau}$ on treatment entry with calendar-time effects, clean-control sample; its SE, $R^2$ and Observations come from that regression. Coefficients are 100×log points (shares in pp). SEs clustered by unit (cell/tract). Control band 1,500–2,000m. Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

| | 0–250m | 250–500m | 500–1000m | 1000–1500m |
|---|---|---|---|---|

| Treated | 5.33*** | 7.82*** | 6.58*** | 6.60*** | 11.92*** |
| | (1.40) | (1.41) | (1.42) | (1.43) | (1.38) |
| Observations | 12,379 | 12,371 | 12,518 | 12,459 | 12,597 |
| R-squared | 0.154 | 0.129 | 0.125 | 0.166 | 0.181 |
| Calendar-year effects | Yes | Yes | Yes | Yes | Yes |
| Event×ring cell differencing | Yes | Yes | Yes | Yes | Yes |
| Hedonic controls | No | No | No | No | No |

Table 17: **Wide-band decay with linear detrending, 2.5–3.5km control (figs. D5–D7)** The Treated coefficient is the post−pre effect from a single LP-DiD regression via pre-mean differencing (Dube, Girardi, Jordà and Taylor 2023): dependent variable $\frac{1}{4}\sum_{h=0}^{3} y_{t+h} - \frac{1}{4}\sum_{\tau=t-4}^{t-1} y_\tau$ on treatment entry with calendar-time effects, clean-control sample; its SE, $R^2$ and Observations come from that regression. Coefficients are 100×log points (shares in pp). SEs clustered by unit (cell/tract). Detrended post subtracts the per-bin linear pre-drift (fit through the base period) times the mean post horizon (2.5); its SE is the unadjusted pooled-post SE (trend treated as known). Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

Table 18: **Decay to 4km with linear detrending, 4–5km control (figs. D8–D11)** The Treated coefficient is the post−pre effect from a single LP-DiD regression via pre-mean differencing (Dube, Girardi, Jordà and Taylor 2023): dependent variable $\frac{1}{4}\sum_{h=0}^{3} y_{t+h} - \frac{1}{4}\sum_{\tau=t-4}^{t-1} y_\tau$ on treatment entry with calendar-time effects, clean-control sample; its SE, $R^2$ and Observations come from that regression. Coefficients are 100×log points (shares in pp). SEs clustered by unit (cell/tract). Detrended post subtracts the per-bin linear pre-drift (fit through the base period) times the mean post horizon (2.5); its SE is the unadjusted pooled-post SE (trend treated as known). Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

| | (2.88) | | | |

Table 29: **Investor Purchases vs Placebo Luxury Purchases** Placebo events are 1,500 purchases by individual non-investor buyers in the investor price band, drawn from the same micro-areas and more than three years from any real event; both series use far rings matched at 400–750m. A price response unique to investor purchases rules out generic luxury-transaction effects. The Treated coefficient is the post−pre effect from a single LP-DiD regression via pre-mean differencing (Dube, Girardi, Jordà and Taylor 2023): dependent variable $\frac{1}{4}\sum_{h=0}^{3} y_{t+h} - \frac{1}{4}\sum_{\tau=t-4}^{t-1} y_\tau$ on treatment entry with calendar-time effects, clean-control sample; its SE, $R^2$ and Observations come from that regression. Coefficients are 100×log points (shares in pp). SEs clustered by unit (cell/tract). Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

| | Investor purchases | Placebo purchases |
|---|---|---|
| | (1) | (2) |
| Treated | 4.43*** | -0.33 |
| | (1.46) | (1.40) |
| Observations | 12,036 | 7,932 |
| R-squared | 0.109 | 0.258 |
| Calendar-year effects | Yes | Yes |
| Event×ring cell differencing | Yes | Yes |
| Hedonic controls | No | No |

Table 30: **Ring-design treatment effects: county-year shocks and house-characteristic controls** This table subjects the ring design's estimates to a specification ladder, using the paper's baseline estimator throughout: the pre-mean-differenced LP-DiD on the event×ring cell panel ($H$=3, $k$=4; clean-control sample: newly treated near cells at onset plus never-treated cells; specification (1) reproduces the baseline table exactly). Specifications: (1) calendar-year effects; (2) county×year effects (the county is the event's municipio), so identification is within municipio-year; (3) adds house-characteristic controls from the transaction data — cell-year means of log assessed structure value, log lot size (cabida), sub-unit share, and vacant-land share, each pre-mean differenced exactly like the outcome — so the column (3) Treated coefficient is a constant-composition price effect. Cell fixed effects are subsumed by the long-differencing. Outcomes: cell mean log sale price (×100) and the net Hispanic-to-non-Hispanic ownership conversion rate per classified sale (percentage points). Robust standard errors are clustered at the cell level and reported in parentheses. Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

Table 31: **Summary Statistics** This table presents summary statistics for the paper's main samples. Panel A: market sales within 1km of an identified decree-era investor purchase (ring design estimation sample: gap ring, junk/nominal prices, and investor-parcel sales excluded; events 2012+); name-classification indicators are defined over sales whose parties' surnames classify. Panel B: Red Atlas tract×year panel (transaction-count-weighted annual mean prices); identified purchases reported over the 235 treated tracts. Panel C: HMDA tract×year panel of originated first-lien owner-occupied 1–4 family purchases, 2012–2024. Panel D: 2010 PRCS tract characteristics (2020 boundaries, population-weighted).
