

Tables: one per figure

Table 1: **2010 Characteristics by Tract Treatment Status** This table presents summary statistics for 2010 PRCS (ACS 2006–2010 5-year) tract characteristics — all pre-determined relative to Act 22 (January 2012) — separated by tracts that ever receive an identified decree-era investor purchase (treated) and tracts that never do. Column (7) reports the raw mean difference between treated and never-treated tracts and column (8) the difference after residualizing out municipio (county) fixed effects, with heteroskedasticity-robust p -values in parentheses. Dollar variables in 2010 dollars; shares in $[0,1]$. 2010 tracts are mapped to 2020 boundaries by largest land overlap, population-weighted. Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

	Treated Tracts			Never-Treated Tracts			Mean Diff.	Adj. Mean Diff.
	Mean	Std. Dev.	Observations	Mean	Std. Dev.	Observations	[(1) – (4)]	[(1) – (4)]

Table 2: **Tract-level treatment effects are robust to county-year shocks and baseline-trend controls**
This table reports pooled difference-in-differences estimates of the treatment indicator (1 from the tract's first identified decree-era purchase onward; never-treated tracts as controls) under three specifications per outcome: (1) tract and year fixed effects; (2) tract and county $\times$ year fixed effects; (3) adds ten standardized 2010 PRCS baseline characteristics (median household income, home value, and gross rent; poverty, BA+, renter, vacancy, seasonal-home, and mainland-born shares; log population) interacted with Post ($1\{\text{year} \geq 2020\}$, the boom era). Panel A: tract log price (Red Atlas, count-weighted annual mean, 2012–2024) and log mean purchase-borrower income (HMDA, 2012–2024), both scaled by 100 (OLS). Panel B: purchase origination counts by borrower ethnicity (Poisson; coefficients $\times 100 \approx$ percent effects, pseudo R-squared reported). Robust standard errors are clustered at the tract level and reported in parentheses. Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

Panel A: prices and borrower income (OLS)

Table 3: **Price Effects by Investor Concentration: Ring and Tract Designs** This table reports LP-DiD price effects by investor concentration under both designs, on the tract design’s dose convention. Columns (1)-(2): ring design, events split by total identified purchases within 1km of the event (the event itself included); each group’s near rings (0–250m) vs never-treated control rings, cell-level annual LP-DiD. Columns (3)-(4): tract design, treated tracts split by identified purchases in the tract, each group vs never-treated tracts. Pre and post pooled coefficients are relative to the $t-1$ base; Post–pre is the single pre-mean-differenced LP-DiD regression (Dube et al. 2023), whose SE, R-squared, and Observations are reported. All outcomes $100 \times \log$ price; SEs clustered by cell (ring) or tract. Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

	<i>Ring design</i>		<i>Tract design</i>	
	1–4 purch. (1)	5+ purch. (2)	1–4 purch. (3)	5+ purch. (4)

Table 17: **Wide-band decay with linear detrending, 2.5–3.5km control (figs. D5–D7)** LP-DiD pooled estimates; pre and post pooled coefficients are relative to the $t-1$ base. Post–pre is estimated in a single LP-DiD regression via pre-mean differencing (Dube, Girardi, Jordà and Taylor 2023): dependent variable $\frac{1}{4} \sum_{h=0}^3 y_{t+h} - \frac{1}{4} \sum_{\tau=t-4}^{t-1} y_{\tau}$ on treatment entry with calendar-time effects, clean-control sample; its SE, R^2 and Observations come from that regression. Coefficients are $100 \times \log$ points (shares in pp). SEs clustered by unit (cell/tract). Detrended post subtracts the per-bin linear pre-drift (fit through the base period) times the mean post horizon (2.5); its SE is the unadjusted pooled-post SE (trend treated as known). Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

Table 30: **Ring-design treatment effects are robust to county-year shocks and baseline-trend controls**
This table subjects the ring design’s pooled estimates to the same specification ladder as the tract-level outcomes, on the event×ring cell panel: the coefficient is the near-ring × post-event indicator (TWFE; by construction below the clean-control LP-DiD pooled post estimate). Specifications: (1) cell and year fixed effects; (2) cell and county×year fixed effects (the county is the event’s municipio); (3) adds ten standardized 2010 PRCS characteristics of the event’s tract interacted with Post ($1\{\text{year} \geq 2020\}$). Outcomes: cell mean log sale price ($\times 100$) and the net Hispanic-to-non-Hispanic ownership conversion rate per classified sale (percentage points). Robust standard errors are clustered at the cell level and reported in parentheses. Statistical significance levels are indicated as follows: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

Table 31: **Summary Statistics** This table presents summary statistics for the paper’s main samples. Panel A: market sales within 1km of an identified decree-era investor purchase (ring design estimation sample: gap ring, junk/nominal prices, and investor-parcel sales excluded; events 2012+); name-classification indicators are defined over sales whose parties’ surnames classify. Panel B: Red Atlas tract×year panel (transaction-count-weighted annual mean prices); identified purchases reported over the 235 treated tracts. Panel C: HMDA tract×year panel of originated first-lien owner-occupied 1–4 family purchases, 2012–2024. Panel D: 2010 PRCS tract characteristics (2020 boundaries, population-weighted).
