Calendar-year effects	Y	Y
Event×ring cell differencing	Y	Y
Hedonic controls	N	N
R ²	0.154	0.104
Observations	12,379	12,034

LP-DiD pooled estimates; pre and post pooled coefficients are relative to the $t-1$ base. Post–pre is estimated in a single LP-DiD regression via pre-mean differencing (Dube, Girardi, Jordà and Taylor 2023): dependent variable $\frac{1}{4} \sum_{h=0}^3 y_{t+h} - \frac{1}{4} \sum_{\tau=t-4}^{t-1} y_{\tau}$ on treatment entry with calendar-time effects, clean-control sample; its SE, R^2 and Observations come from that regression. Coefficients are 100×log points (shares in pp). SEs clustered by unit (cell/tract).

Observations	12,379	2,164	777,666	730,276

The Post—pre row is the comparable differential across estimators. Column (1): cell-level LP-DiD, pooled never-treated controls; post—pre, R² and N from the single pre-mean-differenced regression (Dube et al. 2023). Column (2): the same PMD regression with event×calendar-year effects absorbed (within-event identification: each near ring vs its own event’s far ring); pooled pre/post are the corresponding lpdid coefficients. Columns (3)-(4): stacked sale-level OLS; the near×post coefficient is itself the differential, SEs clustered by event. Long-differencing subsumes event×ring FE in the LP-DiD columns. 100×log points.

Table 12: Spatial decay, 1.5–2km control band (figs. D1–D3)

Table 20: HMDA total originations (fig. H3)

	(1) Total
Pooled pre	-10.46*** (3.78)
Pooled post	+1.90 (4.94)
Post – pre	+12.36** (6.22)
Tract FE	Y
Year FE	Y
County×Year FE	N
R ²	0.292
Observations	6,188

Poisson (PPML) origination counts; pooled post is the single treat coefficient; pooled pre is the average of the $h = -3, -2$ event-study leads (independence-approx. SE). $100 \times \text{coefficient} \approx \text{percent}$. SEs clustered by tract. Pseudo- R^2 reported.

Table 21: HMDA total originations (county-adjusted) (fig. H3cfe)

	(1) Total
Pooled pre	-10.94*** (3.73)
Pooled post	+3.06 (5.17)
Post – pre	+14.00** (6.37)
Tract FE	Y
Year FE	–
County×Year FE	Y
R ²	0.317
Observations	6,102

Poisson (PPML) origination counts; pooled post is the single treat coefficient; pooled pre is the average of the $h = -3, -2$ event-study leads (independence-approx. SE). $100 \times \text{coefficient} \approx \text{percent}$. SEs clustered by tract. Pseudo- R^2 reported.

Table 22: Tract-level price event study (fig. T1)

	(1)	(2)	(3)
	Weighted price	Weighted price	Simple mean
Pooled pre	-1.40 (1.61)	-1.53 (1.67)	-2.11 (1.57)
Pooled post	+7.55*** (1.81)	+7.51*** (1.82)	+6.05*** (1.76)
Post – pre	+6.44*** (1.41)	+6.44*** (1.41)	+5.69*** (1.45)
Tract differencing (LP-DiD)	Y	Y	Y
Calendar-year effects	Y	Y	Y
County FE	N	Y	N
R ²	0.153	0.153	0.168
Observations	11,714	11,714	11,714

LP-DiD pooled estimates; pre and post pooled coefficients are relative to the $t-1$ base. Post–pre is estimated in a single LP-DiD regression via pre-mean differencing (Dube, Girardi, Jordà and Taylor 2023): dependent variable $\frac{1}{4} \sum_{h=0}^3 y_{t+h} - \frac{1}{4} \sum_{\tau=t-4}^{t-1} y_{\tau}$ on treatment entry with calendar-time effects, clean-control sample; its SE, R^2 and Observations come from that regression. Coefficients are 100×log points (shares in pp). SEs clustered by unit (cell/tract).

Table 23: Tract price effects by concentration (fig. T2)

	(1)	(2)
	5+ purchases	1-4 purchases
Pooled pre	+3.84 (3.81)	-2.65 (1.75)
Pooled post	+18.31*** (2.88)	+3.76* (2.12)
Post – pre	+16.30*** (2.54)	+4.13*** (1.59)
Tract differencing (LP-DiD)	Y	Y
Calendar-year effects	Y	Y
County FE	N	N
R ²	0.152	0.153
Observations	11,476	11,670

LP-DiD pooled estimates; pre and post pooled coefficients are relative to the $t-1$ base. Post–pre is estimated in a single LP-DiD regression via pre-mean differencing (Dube, Girardi, Jordà and Taylor 2023): dependent variable $\frac{1}{4} \sum_{h=0}^3 y_{t+h} - \frac{1}{4} \sum_{\tau=t-4}^{t-1} y_{\tau}$ on treatment entry with calendar-time effects, clean-control sample; its SE, R^2 and Observations come from that regression. Coefficients are $100 \times \log$ points (shares in pp). SEs clustered by unit (cell/tract).

Table 24: Tract transaction volume (fig. T3)

	(1)
	ln sales
Pooled pre	-7.73*** (2.23)
Pooled post	-5.85** (2.41)
Post – pre	-0.48 (2.13)
Tract differencing (LP-DiD)	Y
Calendar-year effects	Y
County FE	N
R ²	0.720
Observations	11,714

LP-DiD pooled estimates; pre and post pooled coefficients are relative to the $t-1$ base. Post–pre is estimated in a single LP-DiD regression via pre-mean differencing (Dube, Girardi, Jordà and Taylor 2023): dependent variable $\frac{1}{4} \sum_{h=0}^3 y_{t+h} - \frac{1}{4} \sum_{\tau=t-4}^{t-1} y_{\tau}$ on treatment entry with calendar-time effects, clean-control sample; its SE, R^2 and Observations come from that regression. Coefficients are 100×log points (shares in pp). SEs clustered by unit (cell/tract). Pre-trends fail for this outcome; descriptive only.

Table 25: Observed tract effects vs ring-implied predictions (fig. T4)

Group	Observed	Pred. (central)	Pred. (conserv.)	Gap
All treated	+7.55*** (1.81)	+5.76	+5.13	+1.79
1–4 purchases	+3.76* (2.12)	+5.37	+4.56	-1.61
5+ purchases	+18.31*** (2.88)	+7.45	+7.57	+10.86

Observed: LP-DiD pooled post (group vs never-treated tracts), SEs clustered by tract. Predictions: stock-value-weighted distance-gradient effects over each treated tract's parcels, averaged within group. Gap = observed minus central prediction. $100 \times \log$ points.
